Executive Summary

Appointment	In November 2020 Curtins were instructed by MUSE Developments Ltd to undertake a Phase 1 Preliminary Risk Assessment of a site off Harton Quay, South Shields NE33 1EQ. The site is centred on NGR NZ359669 and covers an area of approximately 0.51 Ha. It is understood that the proposed site development is a 5-storey office structure with mixed use at ground
	floor, along with associated basement for underground car parking
The site is located between Harton Quay and Mill Dam roads. The sites topograp approximately 5m from north to south. Current Site Status Hardstanding is located across the north and central sections of the site with overgrown g southern section of the site. There is an electric sub-station located central along the western and southern boundaries of the site.	
	Earliest mapping (1857) shows that the site occupied by Swinburne's Glass Works and a Stone Yard occupying the western and eastern sides of the site respectively. By the late 19 th century, the glass works has extended across the site. Local industries included glass works, engineering works, dock yards and St Hilda Colliery from 200m east.
Site History	By 1915, the glass works is demolished, and railway lines cross the southern area of the site to a tunnel on the eastern boundary. Buildings and a chimney related to a Wagon Repair Works are constructed in the southern area of the site. From the 1950s, the railway lines and sidings extend to occupy the northern area of the site as well. Staith House is constructed along the south-eastern boundary and a large cutting is mapped in the centre of the northern area of the site by 1968.
	Redevelopment of the site and surrounding area occurs from 1993, when the works and railway lines on site are demolished / removed, with the chimney and Staith House remaining. Conveyor belts are shown to cross the site east-west from Harton Low Staiths to the west to the tunnel on the eastern boundary.
	In recent years, an electrical substation was constructed on the western boundary; the chimney height was reduced; and the site was used as a hard-standing car park.
	BGS mapping indicates the site is underlain by an unknown depth of Made Ground, Glaciolacustrine Deposits (clay and silt), overlying the Pennine Middle Coal Measures Formation.
Geology	The site is in a coal mining area, with a deep coal mine located 212m east at St Hilda Colliery. The development site is not located within a development high risk area.
	The site is located in a low probability radon area where <1% of homes are estimated to be at or above the radon Action Level.
Hydrogeology	The site is underlain by Unproductive Strata within the superficial deposits and a Secondary A Aquifer associated with the bedrock formation. There are no groundwater abstraction points located within 1km and the site is not located within a Source Protection Zone (SPZ).
Hydrology	The nearest surface water feature is the River Tyne 53m west of the site; no water quality data is available for this river within 1km. There are no surface water abstractions within 1km.
	There are four active discharge consents within 250m of the site, with the nearest located 73m west.
Unexploded Ordnance Risk The risk from UXO associated with WWII bombing to construction workers is considered to Detailed Unexploded Ordnance risk assessment report is currently being obtained for anticipated that mitigation measures will be required during any intrusive investigation working risk of encountering unexploded ordnance.	
Other Considerations	Relic foundations associated with historic industrial uses, Glass Cones, chimneys, railway infrastructure and tunnels may remain beneath the site.
Initial Ground Contamination Assessment	The risk from Made Ground posed to the site's end-users and construction workers is considered to be Moderate due to the historical industrial land use of the site since pre-1850s. The risk presented to groundwater and surface water receptors is considered to be Moderate/Low and Low respectively due to no abstraction points within 1km and the site being located in a heavily industrialised area.
	The risk posed to site end-users from ground generating gases arising from organic / putrescible soils on or near the site is considered to be Moderate .

Recommendations

The following recommendations are made with regards to further works at the site:

- Obtain a Detailed UXO Risk Assessment Report prior to any intrusive works being undertaken at the site:
- 2. Undertake an intrusive ground investigation;
- 3. Undertake a GQRA as part of the ground investigation; and
- Undertake Ground Gas Monitoring over a period of two-three months for methane, carbon dioxide, oxygen, hydrogen sulphide, gas flow in l/hr, weather conditions and barometric pressure (with confirmation if falling, steady or rising).

It is further recommended that this work is completed in advance of any development works taking place.

Phase 1 Preliminary Risk Assessment

Appendices

Appendix A Drawings

Appendix B Envirocheck Report

Appendix C Qualitative Risk Assessment Rationale

1.0 Introduction

1.1 Project Background

In November 2020 Curtins were instructed by MUSE Developments Ltd to undertake a Phase 1 Preliminary Risk Assessment of a site off Harton Quay, South Shields NE33 1EQ.

The location and extent of the site is shown in *Figure 2.1* on the following page. The site is bound by Harton Quay to the west and north; Mill Dam to the east; and Daltons Lane to the south. It is understood that the proposed site development is a 5-storey office structure with mixed use at ground floor, along with associated basement for underground car parking.

1.2 Scope of Services

The Phase 1 PRA is intended to provide an overview of the geo-environmental and geotechnical setting of the site, prior to the proposed development of the site.

Proposed development drawings for the site are included in *Appendix A*.

Through this overview, the Phase 1 PRA aims to develop both a working conceptual and ground model for the site, as well as present an initial assessment of any risks that could be presented to the development including its intended end users and the wider environment.

Specifically, the Phase 1 PRA provides an initial assessment of the site regarding:

- a) Potential on and offsite contamination from historical and/or current uses, including potential ground gas generating sources;
- b) The potential impact on the wider environment by historical and or current use of the site of interest;
- The potential impact from surrounding land uses and other environmental factors;
- d) Potential problems associated with geological features such as faulting, mineral extraction, mining and land instability;
- e) The location of apparent sub-surface structures that may affect the proposed redevelopment; and

Consideration of detailed flood risk, ecology and archaeological issues are outside of the scope of this report.

2.0 Current Site and Surrounding Area Details

2.1 Site Location and Current Details

Site use, location and description are shown below in *Table 2.1* and *Figure 2.1*.

Table 2.1 - Site Details

Site Address	Address Harton Quay, South Shields NE33 1EQ	
NGR	NZ 35953 66930	
Area of Site	Approximately 0.51Ha	
Current Site Use and Description	The site is located between Harton Quay and Mill Dam roads. The sites topography slopes down approximately 5m from north to south. Hardstanding is located across the north and central sections of the site with overgrown grass covering the southern section of the site. There is an electric sub-station located central along the western boundary and an historic chimney (a monument to the former Swinburne glassworks) within the southwestern corner. Historic walls (remnant of the historic Staith House) are located along the northern, eastern and southern boundaries of the site. An earth mound is present within the east of the site.

2.2 Surrounding Area Details

The following information was established through undertaking an environmental database search (Envirocheck report (Ref. 1) included in *Appendix B*).

Table 2.2 - Surrounding Land Uses

N BT's office.		BT's office.
	NE	Roundabout, Commercial Road and Supermarket beyond
Surrounding Area	SE	Mill Dam roadway and terraced commercial properties.
	w	Harton Quay, landscaped waterfront area with River Tyne beyond.
	S	Customs House Theatre.

3.0 Site History

A review of the available historical mapping and other information for the site, as presented within the Envirocheck Report (Ref. 1) and contained within *Appendix B*, has been undertaken and is presented in *Table 3.0* below.

Table 3.0 – Previous Site and Surrounding Area Uses and Potential Sources of Contamination. **Bold text refers** to on-site activity.

Date	Description	Potential Sources of Contamination	
	The earliest available mapping (1857) shows the site as part of the Swinburne's Glass Works with the extent of the factory covering the whole of the western and southern sections of the site. A Glass Cone and part of a second Cone are mapped in the north-western corner of the site.		
	A road recorded as 'New Road' runs through the centre of the site from the north to the southwest corner, Coronation Street is present along the site's eastern boundary. A Stone Yard is present in the northeast of the site which extends north of the site.	Potential contamination arising from the construction and operation of industrial land uses the costs including the Class.	
1857 - 1862	The area within 250m surrounding the site is highly industrial, with works including the Swinburne's Glass Works extending to the west and north; Mill Dam Landing and Yard south; Tyne & Tees Glass Works, Subscription Brewery, graveyard and a Rail Depot marked as Low Station, with associated coal yard, all located within 100m of the site. Beyond includes a Stone Quay Boiler Works 200m south, markets and town hall 60m north and St Hilda Colliery 138m east of the site. Ballast Hills and associated railway lines and sidings are located from 125m southeast and 200m south. Two tunnel entrances are recorded within close proximity of the site. One located 55m west and another 145m east. A Gas Works and three gasometers are located from 150m east. The River Tyne is located approximately 80m west.	the onsite, including the Glass Works and Stone Yard. • Potential contamination arising from nearby industrial land uses, including colliery, coal depots, railway infrastructure, brewery and gas works.	
	By 1897 the Swinburne Glass Work factory has extended to encompass the entire site and New Road through the site and the Stone Yard are no longer mapped. The Glass Works is mapped as disused.	Potential for uncontrolled	
1897	The Harton Colliery Staiths is recorded 55m west of the site adjacent to the Glass works and along the bank of the River Tyne. The tunnel entrances are no longer recorded on the map. The Mill Dam loading now has a landing stage. The Rail depot has expanded which has developed Ballast Hill into a Goods Station with a vast array of railway lines and sidings.	deposition of Made Ground during on-site and surrounding construction.	
1915 - 1956	The Swinburne Glass Work factory has been demolished by 1915. Railway lines leading from the Harton Low Staiths to the west cross the centre of the site to a tunnel located along the eastern boundary of the site, with the tunnel going east towards what was St Hilda Colliery. Where the railway enters the tunnel it appears that there is an area of cutting. A new building has been constructed within the southern section of the site which railway lines run into, with a chimney recorded within the building along the southwestern boundary.	 Potential for uncontrolled deposition of Made Ground during surrounding construction and demolition works, including potential for asbestos. Potential uncontrolled deposition of Made Ground from railway lines across site and chimney onsite. Tunnel present on eastern boundary. 	

Description	Potential Sources of Contamination
The Swinburn Glass Work Factory is no longer marked. The Harton Colliery Staiths now marked as Harton Low Staiths has undergone expansion. A tunnel is outlined aligned east to west adjacent to the eastern boundary of the site and seems to connect with the railway line from Harton Low Staiths which crosses the site. St Hilda Colliery has been replaced by railway lines. Surrounded land is still heavily industrialised. Two chimneys are located within 50m west. Industries within 100m include a smithy, engineering works and timber yard. The large gasometer is no longer mapped by 1915.	
The building within the south of the site is marked as Wagon Repair Works. The tunnel is still present on the eastern boundary. More railway lines linked to the Harton Low Staiths network cover more of the site to the north. By 1968 Staith House is recorded with the buildings along the south-eastern boundary. A large cutting is mapped in the north-western area of the site, with a railway line mapped through this cutting aligned north-south by 1968. An electric sub-station is listed 50m west of the site associated with Harton Low Staiths. What was the Smithy 30m east is mapped as a Cabinet Making Works by 1956. A Battery Factory is recorded 100m east of the site which the tunnel that starts at the boundary of the site crosses under. Significant redevelopment of the area from 100m southwest has occurred by the 1950s, with the area redeveloped as a large Graving Dock and Clothing Factory. Ruins are recorded from 100m north of the site. By 1968, the Harton Low Staiths railway network advances in development and the surrounding demolished buildings and ruins have been reconstructed including the construction of a conveyor. A roundabout has built adjacent to the northeast corner of the site.	 Potential for uncontrolled deposition of Made Ground during on-site construction works and the use of the site as a Wagon Repair Works and associated chimney and railway infrastructure crossing the whole site. Potential unexploded UXOs from WW2 onsite or surrounding site associated with vast demolition and ruins.
All railway lines are no longer marked onsite. A conveyor from the Harton Low Staiths extends across the site which joins with the tunnel which is located along the eastern boundary. Staith House and the chimney are still present located on the eastern and south-western boundaries respectively. The railway lines are no longer present at Harton Low Staiths but multiple conveyors are present. Redevelopment of the surrounding area has commenced, with the majority of the railway infrastructure to the south and east no longer mapped.	Potential for uncontrolled deposition of Made Ground associated with demolition of historic industrial buildings, and the potential removal of / decommissioning of the railway infrastructure.
Conveyors are no longer onsite by 1999. By 2006, Harton Quay roadway has been constructed along the site's western and northern boundaries. The Staith Houses are still present onsite until being demolished in 2017. The chimney height has been reduced but the feature is still located within the south-western corner of the site. An electrical sub-station is present onsite along the western boundary. The site is hardstanding and used as a car park until between 2013 and 2015. The site is now currently hardstanding in the north and overgrown grass covering the south of the site.	 Potential for uncontrolled deposition of Made Ground associated with demolition of / removal of conveyor belts and the reduction in the height of the chimney. Potential for fuel / oil spills associated with the site being used as a car park.
	The Swinburn Glass Work Factory is no longer marked. The Harton Colliery Staiths now marked as Harton Low Staiths has undergone expansion. A tunnel is outlined aligned east to west adjacent to the eastern boundary of the site and seems to connect with the railway line from Harton Low Staiths which crosses the site. St Hilda Colliery has been replaced by railway lines. Surrounded land is still heavily industrialised. Two chimneys are located within 50m west. Industries within 100m include a smithy, engineering works and timber yard. The large gasometer is no longer mapped by 1915. The building within the south of the site is marked as Wagon Repair Works. The tunnel is still present on the eastern boundary. More railway lines linked to the Harton Low Staiths network cover more of the site to the north. By 1968 Staith House is recorded with the buildings along the south-eastern boundary. A large cutting is mapped in the north-western area of the site, with a railway line mapped through this cutting aligned north-south by 1968. An electric sub-station is listed 50m west of the site associated with Harton Low Staiths. What was the Smithy 30m east is mapped as a Cabinet Making Works by 1956. A Battery Factory is recorded 100m east of the site which the tunnel that starts at the boundary of the site crosses under. Significant redevelopment of the area from 100m southwest has occurred by the 1950s, with the area redeveloped as a large Graving Dock and Clothing Factory. Ruins are recorded from 100m north of the site. By 1968, the Harton Low Staiths railway network advances in development and the surrounding demolished buildings and ruins have been reconstructed including the construction of a conveyor. A roundabout has built adjacent to the northeast corner of the site. All railway lines are no longer marked onsite. A conveyor from the Harton Low Staiths extends across the site which joins with the tunnel which is located along the eastern boundary. Staith House and the chimney are still present located on the easte

Date	Description	Potential Sources of Contamination
	theatre by 1999. The Harton Low Staiths has been demolished by 1999 and by 2013 has been turned into the Harton Quay park. The BT offices 20m north of the site were constructed by 2012.	

Potential sources of onsite contamination are further discussed in Section 6.0.

4.0 Geology, Hydrogeology and Hydrology

4.1 Geology and Hydrogeology

A study of the Envirocheck (Ref. 1) Report and the British Geological Survey (BGS) 1:50,000 mapping records (Bedrock and Superficial Editions) for Sunderland (Sheet 021) (Ref. 2) indicates the following geological and hydrogeological succession underlying the site:

Table 4.1a - Geological/Hydrogeological Succession

Geology	Associated Hydrogeological Classification
Made Ground	N/A
Glaciolacustrine Deposits, Devensian ¹	Unproductive Strata ²
Pennine Middle Coal Measures Formation ³	Secondary A Aquifer⁴

Notes:

BGS Records indicate the presence of Made Ground on site, and due to the site's historical use as part of a Glass Works, Wagon Repair Works and with extensive railway lines and sidings crossing the site, there is potential for deep Made Ground deposits.

Pennine Middle Coal Measures Formation is mapped to underlie all the site with sandstone bedrock across the site and mudstone, siltstone and sandstone bedrock within the northwest corner only. There is a fault located on site within the north of the site aligned northwest to southeast from the northwest corner.

There are over 20 BGS recorded boreholes located within 250m of the site boundary (Ref. 3). The three nearest and available boreholes are detailed and presented within *Table 4.1b* below:

Table 4.1b - BGS Borehole Records

Record	Location	Details				
Reference	(NGR)	(bottom to top of strata/details/thickness of strata)				
NZ36NE198/B29	39m East (436000, 566880)	0.00m to 0.30m bgl 0.30m to 10.36m bgl 10.36m to 10.67m bgl 10.67m to 12.50m bgl 12.50m to 12.98m bgl 12.98m to 13.10m bgl	Topsoil (0.30m) Made Ground/fill (10.06m) Sand and Gravel (0.31m) Clay and Clayey Silt with shell fragments (1.83m) Clay with Gravel of mudstone (0.48m) Yellow Sandstone BEDROCK (0.12m) Borehole terminated no bedrock			

^{1.} Clay and Silt deposits.

^{2.} These has been assigned in cases where it has not been possible to attribute either category A or B to a rock type. In most cases, this means that the layer in question has previously been designated as both minor and non-aquifer in different locations due to the variable characteristics of the rock type.

^{3.} Interbedded grey mudstone, siltstone, pale grey sandstone and commonly coal seams, with a bed of mudstone containing marine fossils at the base, and several such marine fossil-bearing mudstones in the upper half of the unit.

^{4.} These are permeable layers capable of supporting water supplies at a local rather than strategic scale, and in some cases forming an important source of base flow to rivers. These are generally aquifers formerly classified as minor aquifers.

Record Reference	Location (NGR)	Details (bottom to top of strata/details/thickness of strata)			
NZ36NE198/B30	50m East (436050, 566950)	0.00m to 7.62m bgl 7.62m to 10.36m bgl 10.36m to 11.16m bgl 11.16m to 12.65m bgl	Made Ground/fill (7.62m) Silty Clay with Gravel (2.74m) Sand with bands of sandy silt (0.80m) Sand and sandy silt (1.49m) Borehole terminated		
NZ36NE286	44.71m South (435870, 566847)	0.00m to 4.20m bgl 4.20m to 6.40m bgl 6.40m to 9.30m bgl 9.30m to 10.30m bgl 10.30m	Made Ground/fill (4.20m) Sandy Clay (2.20m) Sand (2.90m) Weathered yellow Sandstone (1.00m) Borehole terminated		

The site is not situated within a Source Protection Zone (SPZ) and there are no groundwater abstraction points within 1km.

4.1.1 Mining

A review of the Coal Authority interactive mapping (Ref. 4) for the area indicates that the site is located within a coal mining reporting area.

Consequently, a Mining and Ground Stability datasheet has been obtained with the Envirocheck report (Ref. 1) and is included in *Appendix B*.

The nearest BGS recorded mineral site is the St Hilda Colliery, located 212m east where coal was abstracted from a deep mine; operations have ceased. The nearest opencast operation was at Swinburne's Brick Field, 287m east where common clay and shale were extracted.

The site is not within a development high-risk area related to coal mining, the risk to development from historic coal mining is therefore considered to be **Low** and has not been considered further.

4.1.2 Other Ground Stability Issues

The Envirocheck Report (Ref. 1) confirms that there is a no hazard to very low risk from the following ground stability hazards on the site; collapsible ground, ground dissolution, landslide ground, running sands and shrinking or swelling clay. A moderate risk is recorded for compressible ground.

4.1.3 Ground Gas

The nearest historic landfill site is West Dock, 485m southwest.

The Envirocheck report (Ref. 1) identifies one potentially infilled land (non-water) located 132m southeast of the site dated 1993.

The Envirocheck report (Ref. 1) and UK Maps of Radon (Ref. 5) confirm the site is situated in a lower probability radon area where <1% of homes are above the radon action level. On this basis radon protection measures are not considered necessary in the construction of new dwellings or extensions.

Where the new development incorporates a basement the advice of a specialist Radon assessor must be obtained.

4.2 Hydrology

The nearest surface water feature is the River Tyne, located approximately 53m to the west. There is no river quality data available for this feature.

There are three pollution incidents to controlled waters recorded within 250m of the site however none were within the last 25 years. The nearest located 151m northwest which involved sewage entering the River Tyne which was classed as a category 2 significant incident dated 1990.

There are no surface water abstractions within 1km. There are four active discharge consents recorded within 250m of the site. The nearest located 73m west of the site operator recorded as Northumbrian Water Ltd for storm tank/CSO on sewage network dated January 2005.

5.0 Unexploded Ordnance Risk Assessment

Military activities including those conducted as part of both the First and Second World Wars have resulted in a legacy of unexploded ordnance (UXO) being present within the shallow soils of the UK.

UXO result from various sources including both allied (military training) and German (bombing raids) with a guide figure of approximately 10% of all munitions failing to function as designed.

The likelihood of UXO being encountered on a development site is influenced by several factors including; the proximity to strategic targets, the nature of the development works being undertaken and evidence of local damage in the post-war periods amongst others. To determine the likelihood of UXO being present on a site, a step-wise risk assessment process is followed. This process is outlined within CIRIA C681 Unexploded Ordnance: A Guide for the Construction Industry (Ref. 6) with the following commentary considered to represent a Preliminary Risk Assessment intended to guide if and where there is a requirement for a Detailed Risk Assessment.

5.1 Preliminary UXO Assessment

Risk mapping (Ref. 7) for UXO's has placed the site in a **High** risk area, with Luftwaffe targets located within 300m north and east of the site. High risk areas are those that show a high density of bombing hits (50+ bombs per 1000 acres) and abundant potential WWII targets. In high-risk regions, further action to mitigate UXB risk is considered essential.

Consequently, a Detailed Unexploded Ordnance Risk Assessment report is currently being obtained from a UXO-specialist, and the report will be forwarded to the client.

It is considered likely that the Detailed UXO report will recommend the following mitigation measures are put in place during any intrusive works:

- UXO Safety Briefing with all contractors on site prior to the commencement of intrusive works;
 and
- Down-hole magnetometry surveying throughout the depth of excavations / boreholes by a suitably qualified UXO engineer.

If unexploded ordnance is discovered during any works, stop immediately, prevent access to the area, and inform the police.

If the site boundary or location changes then the UXO risk should be reassessed.

Phase 1 Preliminary Risk Assessment

6.0 Conceptual Site Model & Qualitative Risk Assessment

The conceptual site model (CSM) and Qualitative Risk Assessment (QRA) are presented in the table within this section.

The CSM details the source-pathway-receptor linkages or potential pollutant linkages (PPL) that have been identified for the site. The QRA details the associated level of risk relating to these potential pollutant linkages.

The CSM and QRA concern risk to human health and water environment with additional, more specific risk assessment protocols contained within the main body of this reporting, as detailed in *Section 6.1* below.

The QRA follows the framework outlined within CIRIA C552 (Ref. 8) which is summarised within Appendix C.

The 'risk rating' within the QRA refers to the risk that the source, pathway, receptor linkage or PPL is complete. Unless specifically stated it does not necessarily refer to an immediate risk and is intended to be used as a tool to assess the necessity for further assessment/investigation.

6.1 Additional Risk Assessments

The following risk assessments, listed below, are not included within the main CSM and QRA but nonetheless can be of critical importance to the onward development of the site:

- The risk presented by Mining is discussed and assessed in Section 4.1.1.
- The risk presented by Radon is discussed and assessed in Section 4.1.3.
- The risk presented by Unexploded Ordnance is discussed and assessed in Section 5.0.

Under current health and safety legislation, employers are required to carry out their own appropriate risk assessments and mitigation to protect themselves and their employees, other human receptors and the environment from potential contamination. Such risks must be adequately mitigated by law, specifically the Construction Design Management (CDM) Regulations, 2015 (Ref. 9) which require that potential risks to human health and the environment from construction activities are appropriately identified and all necessary steps taken to eliminate / manage that risk. It has been assumed that any future construction works on site will be undertaken in compliance with these requirements.

Phase 1 Preliminary Risk Assessment

Qualitative Risk Assessment Generic Quantitative Risk Assessment Detailed
Quantitative Risk
Assessment or;
Remedial Action

- The table below represents the first stage in the land quality risk assessment process: The Qualitative Risk Assessment.
- For a development site to be deemed 'suitable for use', the level of risk needs to be brought down to acceptable levels, i.e. low to very low risk. The purpose of each stage of risk assessment is ultimately to establish, if there is a requirement for additional levels of assessment to be made to have sufficient confidence to support a risk characterisation or management decision, e.g. remedial action.
- In the absence of specific site data, a Generic Quantitative Risk Assessment is invariably recommended.

	Conceptual Site Model					
Source	Pathway(s)	Receptor(s)	Consequence	Likelihood of Occurrence	Risk Rating	Recommended Actions
 Significant sources of on-site contamination: Made Ground of unknown composition from uncontrolled deposition of materials onsite during the construction and demolition of industrial buildings, roadways and railway infrastructure. Potential for contamination arising from the historic site uses including Glass Works and associated cones; Stone Yard; Wagon Repair Works and associated chimney and 	Direct contact, ingestion, inhalation (dust and vapours)	End-user of site (Commercial) & Construction Workers	Medium Chronic health risk	Likely Considering the site's establishment as a Glass Works pre-1850s, followed by periods of demolition and redevelopment, it is considered Likely that significant contamination within the Made Ground may be encountered, including the potential for contamination related to the demolition of ACM-containing structures	Moderate	Generic Quantitative Risk Assessment Recommended as part of the ground investigation. Likelihood of construction workers coming into contact with contamination on site can reduced by appropriate PPE.
railway lines, sidings and related infrastructure. • Made Ground of unknown composition and depth associated with the large cutting and tunnel in the northern and eastern areas of the site respectively. • Potential for fuel / oil spillages related to the site's use as a hard-standing car park in recent years. Significant sources of off-site contamination: • Uncontrolled deposition of Made Ground	Vertical migration through the superficial deposits (soils) May occur due to existing service corridors and physical processes including; capillary action and downwards into the natural deposits through infiltration.	Controlled Waters (Groundwater) Secondary A Aquifer (Bedrock), overlain by Glaciolacustrine Deposits (Unproductive Strata). No groundwater abstraction points within 1km. The site is not within a designated Source Protection Zone.	Medium Pollution of sensitive water resources	Low Likelihood Considering the sites historical industrial use and the distance to the nearest water abstraction (>1km) it is considered a low likelihood that this source pathway receptor linkage will be realised. Notwithstanding, considering the likelihood of encountering made ground, the potential for leaching of contamination to the underlying aquifer should be further assessed.	Moderate / Low	Generic Quantitative Risk Assessment Recommended as part of the ground investigation.
during the construction of roads and structures and demolition near and adjacent to the site's boundaries. • Potential for contamination arising from local historical industrial land use, including Glass Works, various engineering works, Colliery, railway goods yards and sidings, gas works and gasometers and dockyards.	Horizontal migration over and through the superficial deposits (soils)	Controlled Waters (Surface Water) Nearest surface water feature is the River Tyne located 53m west, no water quality data available. No surface water abstraction points within 1km.	Mild Pollution of sensitive water resources	Low Likelihood Considering the distance from the site to the nearest surface water receptor and the surrounding heavily industrialised land use, it is considered a low likelihood that this source pathway receptor linkage will be realised between the development site and the River Tyne.	Low	No further action required
Significant sources of ground gas: BGS mapping recorded Made Ground on site to unknown depth and of unknown composition. Potential for Made Ground and superficial soils to contain organic / putrescible material. Coal Mining area.	Vertical and horizontal migration through existing service corridors and the underlying superficial deposits	End-user of site (Commercial)	Medium Human health risk	Likely There is potential for gas generation from Made Ground soils if a significant depth of soils exist and contain organic / putrescible material.	Moderate	Generic Quantitative Risk Assessment Recommended as part of the ground investigation.

Rev V01 |Copyright ©2020 Curtins Consulting Ltd

7.0 Conclusion and Recommendations

The qualitative risk assessment (QRA) determined a varied level of level of risk associated with the proposed development.

The QRA concluded by recommending that generic quantitative risk assessments (GQRA) were conducted to confirm the assessment of risk ascribed to each of the respective potential pollutant linkages (PPLs). It is recommended that the GQRA is conducted as part of a ground investigation in support of the engineering design of the proposed development.

In summary, the following recommendations are made:

- Obtain a Detailed UXO Risk Assessment Report prior to any intrusive works being undertaken at the site;
- Undertake an intrusive ground investigation;
- Undertake a GQRA as part of the ground investigation; and
- Undertake ground gas monitoring over a period of two-three months for potential hazardous gases; and

It is further recommended that the site investigation works are completed in advance of any development works taking place.

7.1 Contaminants of Concern

Potential contaminants of concern associated with the sources identified within the Conceptual Site Model in *Section 6.0* of this reporting include but are not limited to: broad range aliphatic and aromatic hydrocarbons present within any fuel oils; polycyclic aromatic hydrocarbons (PAHs); inorganic compounds including heavy metals; and asbestos present in discarded building materials.

Potential contaminants associated with the airborne dust/particulates include but are not limited to: polycyclic aromatic hydrocarbons and inorganic compounds including toxic metals that are also accounted for by potential onsite contaminants of concern.

7.2 Other Considerations

The requirement for additional surveys, e.g. archaeological, arboricultural and ecological surveys, should be confirmed through advice from a suitably qualified and experienced professional.

Relic foundations associated with historic industrial uses, Glass Cones, chimneys, railway infrastructure and tunnels may remain beneath the site.

Report Section and Details	Page Number
Summary	-
The Summary section provides an overview of the data contained within the report, detailing the	number of data set features

The Summary section provides an overview of the data contained within the report, detailing the number of data set features or the existence of a data set in relation to the buffer selected.

For ease of reference, the report is broken down into 4 sections of data; Mining and Natural Cavities Data, Historical Land Use Information (1:2,500), Historical Land Use Information (1:10,000) and Ground Stability Data (1:50,000).

Mining and Natural Cavities Data

1

The Mining and Natural Cavities Data section features data sets related to the existence of mining areas and their potential hazards; and details of naturally formed cavities.

Data sets within this section are not plotted, with the exception of BGS Recorded Mineral Sites and Potential Mining Areas which feature on the Historical Land Use Information (1:10,000) map.

Historical Land Use Information (1:2,500)

10

The Historical Land Use Information (1:2,500) section contains data captured from analysis carried out by Landmark of 1:1,250 and 1:2,500 scale historical Ordnance Survey mapping, identifying areas where, historically, the land uses were potentially contaminative.

For the purpose of this Envirocheck module, only historical data relating to mining and ground stability has been included and plotted on the corresponding Historical Land Use Information (1:2,500) map. This section also includes the Subterranean Features data set, which details various man-made and man-used underground spaces obtained from the Subterranea Britannica society.

Historical Land Use Information (1:10,000)

11

The Historical Land Use (1:10,000) section covers data captured from the systematic analysis carried out by Landmark of 1:10, 560 and 1:10,000 scale historical Ordnance Survey mapping dating back to the mid-19th century, identifying potentially contaminative past industrial land uses.

For the purpose of this Envirocheck module, only data relating to mining and ground stability has been included and plotted on the accompanying Historical Land Use Information (1:10,000) map.

Ground Stability Data (1:50,000)

13

The Ground Stability (1:50,000) section includes the BGS Geosure data suite, reporting features to 250m and plotted onto 3 separate maps. Also reported is brine subsidence, brine mining and salt mining data sets, of which Brine Pumping and Salt Mining Related Features are plotted, and subsidence insurance claims and insurance investigations data, which is not plotted.

Historical Map List 15

The Historical Map List section details the historical mapping that has been analysed for your site, in relation to the Historical Land Use Information sections.

Introduction

The Environment Act 1995 has made site sensitivity a key issue, as the legislation pays as much attention to the pathways by which contamination could spread,

and to the vulnerable targets of contamination, as it does the potential sources of contamination.

For this reason, Landmark's Site Sensitivity maps and Datasheet(s) place great emphasis on statutory data provided by the Environment Agency/Natural Resources Wales and the Scottish Environment Protection Agency; it also incorporates data from Natural England (and the Scottish and Welsh equivalents) and Local Authorities; and highlights hydrogeological features required by environmental and geotechnical consultants. It does not include any information concerning past uses of land. The datasheet is produced by querying the Landmark database to a distance defined by the client from a site boundary provided by the client. In this datasheet the National Grid References (NGRs) are rounded to the nearest 10m in accordance with Landmark's agreements with a number of Data Suppliers.

Geology 1:50,000 Maps

This report contains geological map extracts taken from the BGS Digital Geological map of Great Britain at 1:50,000 scale and is designed for users carrying out preliminary site assessments who require geological maps for the area around the site. This mapping may be more up to date than previously published paper maps.

The various geological layers - artificial and landslip deposits, superficial geology and solid (bedrock) geology are displayed in separate maps, but superimposed on the final 'Combined Surface Geology' map. All map legends feature on this page. Not all layers have complete nationwide coverage, so availability of data for relevant map sheets is indicated below.

Artificial Ground and Landslip

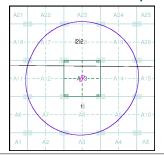

Artificial ground is a term used by BGS for those areas where the ground surface has been significantly modified by human activity. Information about previously developed ground is especially important, as it is often associated with potentially contaminated material, unpredictable engineering conditions and unstable ground.

Artificial ground includes:

- Made ground man-made deposits such as embankments and spoil heaps on the natural ground surface.
 Worked ground - areas where the ground has been cut away such as
- Worked ground areas where the ground has been cut away such a quarries and road cuttings.
- Infilled ground areas where the ground has been cut away then wholly or partially backfilled.
- Landscaped ground areas where the surface has been reshaped.
 Disturbed ground areas of ill-defined shallow or near surface mineral workings where it is impracticable to map made and worked ground separately.

Mass movement (landslip) deposits on BGS geological maps are primarily superficial deposits that have moved down slope under gravity to form landslips. These affect bedrock, other superficial deposits and artificial ground. The dataset also includes foundered strata, where the ground has collapsed due to subsidence.

Superficial Geology

Superficial Deposits are the youngest geological deposits formed during the most recent period of geological time, the Quaternary, which extends back about 1.8 million years from the present.

They rest on older deposits or rocks referred to as Bedrock. This dataset contains Superficial deposits that are of natural origin and 'in place'. Other superficial strata may be held in the Mass Movement dataset where they have been moved, or in the Artificial Ground dataset where they are of man-made origin.

Most of these Superficial deposits are unconsolidated sediments such as gravel, sand, silt and clay, and onshore they form relatively thin, often discontinuous patches or larger spreads.

Page 3 of 5

Bedrock and Faults

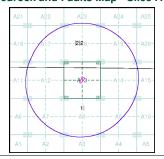

Bedrock geology is a term used for the main mass of rocks forming the Earth and are present everywhere, whether exposed at the surface in outcrops or concealed beneath superficial deposits or water.

The bedrock has formed over vast lengths of geological time ranging from ancient and highly altered rocks of the Proterozoic, some 2500 million years ago, or lafer, up to the relatively young Pliocene, 1.8 million years ago.

The bedrock geology includes many lithologies, often classified into three types based on origin: igneous, metamorphic and sedimentary.

The BGS Faults and Rock Segments dataset includes geological faults (e.g. normal, thrust), and thin beds mapped as lines (e.g. coal seam, gypsum bed). Some of these are linked to other particular 1:50,000 Geology datasets, for example, coal seams are part of the bedrock sequence, most faults and mineral veins primarily affect the bedrock but cut across the strata and post date its deposition.

Combined Surface Geology

The Combined Surface Geology map combines all the previous maps into one combined geological overview of your site.

Please consult the legends to the previous maps to interpret the Combined "Surface Geology" map.

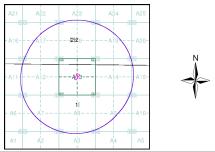

Additional Information

More information on 1:50,000 Geological mapping and explanations of rock classifications can be found on the BGS website. Using the LEX Codes in this report, further descriptions of rock types can be obtained by interrogating the 'BGS Lexicon of Named Rock Units'. This database can be accessed by following the 'Information and Data' link on the BGS website.

Source map scale - 1:500

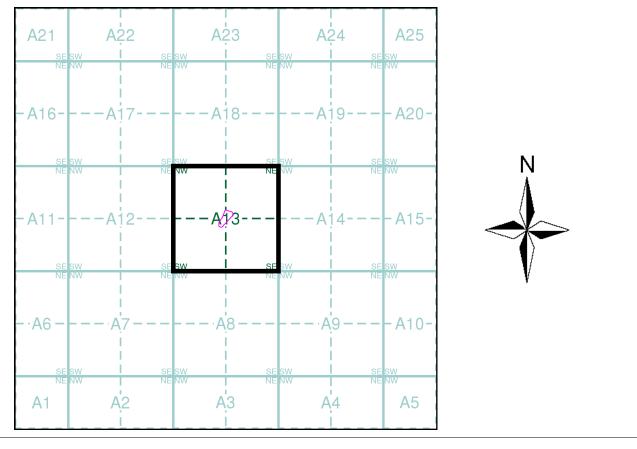

The 1:500 scale Ordnance Survey mapping was introduced in 1855 as a replacement for the 1:528 scale and to compliment the 1:2500 scale that had been implemented in 1853. By 1895, the 1:500 scale covered most towns over a population of about 4000 at the time of survey, although very few towns were mapped more than once at this scale, and none have been since 1910. The 1:500 scale gives particular emphasis to such features as lamp posts, man holes, arched passages and minor building projections. Also often featured are divisions between tenements, interior ground floor layouts of public buildings, and on earlier plans, the functions of the various parts of larger industrial premises are also indicated. Content of the plans does vary however, from one town to the next in terms of, for example, the completeness of railway tracks and the coverage of public buildings.

Please note: Due to the partial coverage of Historical Town Plans, it is possible that not all segments within an order will contain mapping. Only the segments that have Town Plan coverage will be generated.

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840's. In 1854 the 1:2,500 scale was adopted for mapping urban areas and by 1896 it covered the whole of what were considered to be the cultivated parts of Great Britain. The published date given below is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas.

Large-Scale National Grid Data

Published 1993

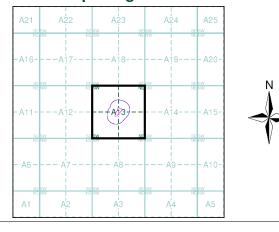

Source map scale - 1:1,250

'Large Scale National Grid Data' superseded SIM cards (Ordnance Survey's 'Survey of Information on Microfilm') in 1992, and continued to be produced until 1999. These maps were the fore-runners of digital mapping and so provide detailed information on houses and roads, but tend to show less topographic features such as vegetation. These maps were produced at both 1:2,500 and 1:1,250 scales.

Published 1862 Source map scale - 1:10,560

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840's. In 1854 the 1:2,500 scale was adopted for mapping urban areas; these maps were used to update the 1:10,560 maps. The published date given therefore is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas. In the late 1940's, a Provisional Edition was produced, which updated the 1:10,560 mapping from a number of sources. The maps appear unfinished - with all military camps and other strategic sites removed. These maps were initially overprinted with the National Grid. In 1970, the first 1:10,000 maps were produced using the Transverse Mercator Projection. The revision process continued until recently, with new editions appearing every 10 years or so for urban areas.

Ordnance Survey Plan Published 1951 - 1952 Source map scale - 1:10,000

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840's. In 1854 the 1:2,500 scale was adopted for mapping urban areas; these maps were used to update the 1:10,560 maps. The published date given therefore is used to update the 1:10,560 maps. The published date given therefore is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas. In the late 1940's, a Provisional Edition was produced, which updated the 1:10,560 mapping from a number of sources. The maps appear unfinished - with all military camps and other strategic sites removed. These maps were initially overprinted with the National Grid. In 1970, the first 1:10,000 maps were produced using the Transverse Mercator Projection. The revision process continued until recently, with new editions appearing every 10 years or so for urban areas.

Newcastle-upon-Tyne Published 1977 Source map scale - 1:25,000

These maps were produced by the Russian military during the Cold War between 1950 and 1997, and cover 103 towns and cities throughout the U.K. The maps are produced at 1:25,000, 1:10,000 and 1:5,000 scale, and show detailed land use, with colour-coded areas for development, green areas, and non-developed areas. Buildings are coloured black and important building uses (such as hospitals, post offices, factories etc.) are numbered, with a numbered key describing their use.

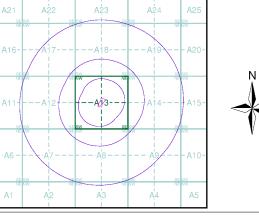

They were produced by the Russians for the benefit of navigation, as well as strategic military sites and transport hubs, for use if they were to have

invaded the U.K. The detailed information provided indicates that the areas were surveyed using land-based personnel, on the ground, in the cities that

Appendix C Qualitative Risk Assessment Rationale

The site-specific risk assessment, presented in this report, follows the principle of establishing whether there is a viable linkage between a contaminant source to a potential receptor, via an exposure pathway.

The risk assessment corresponds with the total site area and incorporates both descriptive (qualitative) and, where available, numerical (quantitative) lines of evidence.

Risk assessment is the process of collating known information on a hazard or set of hazards to estimate actual or potential risk to receptors. The receptor may be humans, a water resource, a sensitive local ecosystem or future construction materials. Receptors can be connected to the source by one or several exposure pathways such as direct contact for example. Risks are generally managed by isolating the receptor or intercepting the exposure pathway or by isolating or removing the hazard.

Without the three essential components of a source, pathway and receptor there can be no risk. Therefore, the presence of contaminant source on a site does not necessarily mean there is a risk.

The risk assessment considers the likelihood of an event taking place (accounting for the presence of the source and receptor and the viability of the exposure pathway) in conjunction with the severity of the potential consequence (accounting for the potential severity of the hazard and the sensitivity of the receptor).

In the risk assessment, the consequence of the hazard has been classified as severe or medium or mild or minor and the probability (likelihood) of the circumstances occurring classified as high likelihood or likely or low likelihood or unlikely.

The consequences and probabilities are subsequently cross-correlated to give a qualitative estimation of the risk using Department of the Environment risk classifications as detailed in the table below and as referenced in CIRIA C552.

		Consequence			
		Severe	Medium	Mild	Minor
) (1	High Likelihood	Very High Risk	High Risk	Moderate Risk	Moderate/Low Risk
Probability (Likelihood)	Likely	High Risk	Moderate Risk	Moderate/Low Risk	Low Risk
Proba Likeli	Low Likelihood	Moderate Risk	Moderate/Low Risk	Low Risk	Very Low Risk
1) (L	Unlikely	Moderate/Low Risk	Low Risk	Very Low Risk	Very Low Risk

076755-CUR-00-XX-RP-GE-001 Harton Quay, South Shields

In accordance with DoE guidance, the following categorisation of **consequence** has been developed.

Classification	Definition	Examples
Severe	Short-term (acute) risk to human health likely to result in "significant harm" as defined by the Environment Protection Act 1990, Part IIA. Short-term risk of pollution of sensitive water resource. Catastrophic damage to buildings/property. A short-term risk to an ecosystem or organisation forming part of such ecosystem.	High concentrations of cyanide on the surface of an informal recreation area. Major spillage of contaminants from site into controlled water. Explosion, causing building collapse (can also equate to a short-term human health risk if buildings are occupied).
Medium	Chronic damage to Human Health. Pollution of sensitive water resources. A significant change in an ecosystem or organism forming part of such ecosystem.	Concentration of a contaminant from site exceeds the generic or site-specific assessment criteria. Leaching of contaminants from a site to a Principal or Secondary A aquifer. Death of a species within a designated nature reserve. Lesser toxic and asphyxiate effects
Mild	Pollution of non-sensitive water resources. Significant damage to crops, buildings, structures and services. Damage to sensitive buildings/structures/services or the environment.	Pollution of non-classified groundwater (inc. Secondary B aquifers). Damage to building rendering it unsafe to occupy (e.g. foundation damage resulting in instability).
Minor	Harm, although not necessarily significant harm, which may result in a financial loss or expenditure to resolve. Non-permanent health effects to human health (easily prevented by means such as personal protective clothing, etc). Easily repairable effects of damage to buildings, structures and services.	The presence of contaminants at such concentrations that protective equipment is required during site works. The loss of plants in a landscaping scheme. Discoloration of concrete.

076755-CUR-00-XX-RP-GE-001 Harton Quay, South Shields

In accordance with DoE guidance, the following categorisation of **probability** has been developed.

Classification	Definition
High Likelihood	There is a pollution linkage and an event that either appears very likely in the short term and almost inevitable over the long term or there is evidence at the receptor of harm or pollution.
Likely	There is a pollution linkage and all the elements are present and in the right place, which means that it is probable that an event will occur. Circumstances are such that an event is not inevitable, but possible in the short term and likely over the long term.
Low Likelihood	There is a pollution linkage and circumstances are possible under which an event could occur. However, it is by no means certain that even over a longer period such event would take place and is less likely in the shorter term.
Unlikely	There is a pollution linkage, but circumstances are such that it is improbable that an event would occur even in the very long term.

In accordance with DoE guidance, the following categorisation of **risk** has been developed.

Classification	Definition
Very High Risk	There is a <i>high probability</i> that <i>severe harm</i> could arise to a designated receptor from an identified hazard at the site without appropriate further action.
High Risk	Harm is likely to arise to a designated receptor from an identified hazard at the site without appropriate further action.
Moderate Risk	It is possible that without appropriate further action harm could arise to a designated receptor. It is relatively unlikely that any such harm would be severe, and if any harm were to occur it is more likely that such harm would be relatively mild.
Low Risk	It is possible that harm could arise to a designated receptor from an identified hazard. It is likely that, at worst, if any harm was realised any effects would be mild.
Very Low Risk	The presence of an identified hazard does not give rise to the potential to cause harm to a designated receptor.

The term 'risk' in this instance refers to the risk that the source, pathway, receptor linkage for a given source of contamination is complete. It does not refer to immediate risk to individuals or features present on the site from potential contaminants and is intended to be used as a tool to assess the necessity of further investigation.
